

## **PERFORMANCE LINER® LATERAL SYSTEM**

The Performance Liner® Lateral System is a unique cured-in-place process that gives the installer the freedom to position the liner anywhere in the pipe by inverting through a cleanout. The liner can be directed either upstream or downstream using LMK's patented guide shoe. In addition, this versatile system is capable of being installed in pipes under foundations, inside walls or in vertical applications.

### **FEATURES:**

- ASTM 3240 and ASTM F1216 compliant
- Pipe diameters from 3 to 8 inches
- Up to 130 feet can be installed from one access point
- Gasket-sealing O-rings placed at the upstream & downstream ends of the liner provide a verifiable, non-leaking liner
- Compressible material at the upstream end of the liner produces a smooth, tapered transition to the old pipe
- Can be installed through a cleanout — no digging
